<b>TAS for VMs overview</b>	<b>80</b>
Introduction to Cloud Platforms	80
About TAS for VMs	81
How TAS for VMs Works	81
Load balancing	81
Running apps	81
VMs in TAS for VMs	82
Distributing apps	82
Organizing users and workspaces	82
Storing resources	83
Communicating with components	83
Monitoring and Analyzing	84
Using services	84
Small Footprint TAS for VMs	84
Differentiate small footprint TAS for VMs and TAS for VMs	84
How TAS for VMs Differs from Open Source Cloud Foundry	85
<b>Release Notes</b>	<b>87</b>
<b>TAS for VMs v6.0 Release notes</b>	<b>89</b>
<b>Releases</b>	<b>89</b>
6.0.18	89
Security Fixes	91
Components	94
6.0.17	151
Security Fixes	152
Component Versions	156
6.0.16	209
Known Issues	211
Addresses Policy Server database migration failures and crashes	211
Security Fixes	211
<b>TAS for VMs v6.0 Release notes</b>	<b>269</b>
<b>Releases</b>	<b>270</b>
6.0.15	270
Security Fixes	271
Component Release Notes	273
6.0.14	313
Security Fixes	314
Component Release Notes	317
6.0.13	329
Security Fixes	331
Component Release Notes	333
6.0.12	358

Security Fixes .....	360
Component Release Notes .....	362
6.0.11 .....	385
Security Fixes .....	387
Component Release Notes .....	405
6.0.1 - 6.0.10 .....	459
<b>New features in VMware Tanzu Application Service for VMs v6.0 .....</b>	<b>459</b>
Updates to GenAI for Tanzu Application Service (beta) .....	459
Improved Autoscaling based on Application CPU Usage .....	459
Improved Platform Footprint and Enhanced Operations .....	460
Enhancements to Enable Improved Platform Security Postures .....	460
Tanzu Application Service Ecosystem Optimizations .....	461
Reduced logging and metric infrastructure requirements .....	461
Reintroduction of global log rate limit .....	461
App Autoscaler supports scaling on CPU entitlement .....	461
<b>Breaking Changes .....</b>	<b>462</b>
<b>Known issues .....</b>	<b>462</b>
cf-networking-release versions 3.67.0 - 3.70.0 bug can break pagination .....	462
Loggregator Agents in other products may log failure when Dopplers are scaled to zero .....	462
UAA causes database overload (for VMware Tanzu Application Service for VMs 6.0.0 and 6.0.1) .....	462
<b>TAS Patch Version v6.0.1-v6.0.10 Release Notes .....</b>	<b>462</b>
<b>Releases .....</b>	<b>462</b>
6.0.10 .....	462
6.0.9 .....	477
6.0.8 .....	502
6.0.7 .....	556
6.0.6 .....	579
6.0.5 .....	608
6.0.4 .....	640
6.0.3 .....	669
6.0.2 .....	675
6.0.1 .....	700
6.0.0 .....	710
<b>TAS for VMs v6.0 Breaking Changes .....</b>	<b>723</b>
<b>Default stacks no longer include cflinuxfs3 .....</b>	<b>723</b>
<b>Absolute CPU Entitlement metrics no longer available .....</b>	<b>724</b>
<b>Breaking changes if you are starting from TAS 5.0 .....</b>	<b>724</b>
Change: gorouter enforces stricter content-length headers when transfer-encoding header is set .....	724
Why Should I Be Concerned About This Change? .....	724
How Can I Tell If I'm Impacted? .....	724
What Should I Do About It? .....	724
App Autoscaler API requires JRE 17 .....	725
Why Should I Be Concerned About This Change? .....	725

How Can I Tell If I'm Impacted? . . . . .	725

Scaling in Single-Process Mode . . . . .	1391
Scaling in Multi-Process Mode . . . . .	1391
<b>    Enable Multi-Process Mode . . . . .</b>	<b>1392</b>
<b>    Migrating from Single-Process to Multi-Process Mode . . . . .</b>	<b>1392</b>
Examples . . . . .	1393
Configuring Your Foundation . . . . .	1393
Other considerations . . . . .	1394
DB Connections . . . . .	1394
Number of API VMs . . . . .	1394
Memory footprint . . . . .	1394
Metrics . . . . .	1394
Post-Migration Fine-Tuning . . . . .	1394
<b>Configuring Diego Cell disk cleanup scheduling . . . . .</b>	<b>1395</b>
<b>    Why disk cleanup is needed . . . . .</b>	<b>1395</b>
<b>    Options for disk cleanup . . . . .</b>	<b>1395</b>
Recommendations . . . . .	1395
Calculating a reserve . . . . .	1396
<b>    Configure disk cleanup scheduling . . . . .</b>	<b>1396</b>
<b>Examining GrootFS disk usage in TAS for VMs . . . . .</b>	<b>1396</b>
<b>    Reconciling container and host disk usage . . . . .</b>	<b>1397</b>
<b>    About container disk usage . . . . .</b>	<b>1397</b>
Retrieve Disk Usage Stats for a single container . . . . .	1397
Retrieve exclusive disk usage stats for all running containers . . . . .	1398
<b>    About volumes in GrootFS . . . . .</b>	<b>1399</b>
Check volume disk size . . . . .	1399
<b>    Determine disk usage and reclaimable disk space . . . . .</b>	<b>1400</b>
Calculate disk use by all active volumes . . . . .	1400
Calculate GrootFS store disk usage . . . . .	1400
Calculate reclaimable disk space . . . . .	1400
How GrootFS reclaims disk space . . . . .	1401
<b>    Other categories of GrootFS disk usage . . . . .</b>	<b>1401</b>
<b>Using metadata in TAS for VMs . . . . .</b>	<b>1402</b>
<b>    About metadata . . . . .</b>	<b>1402</b>
Methods of adding metadata . . . . .	1402

Types of metadata . . . . .	1402
Annotations sent to service brokers . . . . .	1402
Metadata Requirements . . . . .	1403
Requirements for labels . . . . .	1403
Requirements for annotations . . . . .	1403
Metadata key prefixes . . . . .	1404
<b>cf CLI procedures . . . . .</b>	<b>1404</b>
Add metadata to a resource . . . . .	1404
Add a label . . . . .	1404
Update metadata for a resource . . . . .	1405
Remove metadata from a resource . . . . .	1405
Remove a label . . . . .	1405
View metadata for a resource . . . . .	1405
View labels . . . . .	1405
Select resources by labels . . . . .	1405
<b>API procedures . . . . .</b>	<b>1406</b>
Add metadata to a resource . . . . .	1406
Add a label . . . . .	1406
Add an annotation . . . . .	1406
Update metadata for a resource . . . . .	1407
Remove metadata from a resource . . . . .	1407
View metadata for a resource . . . . .	1407
List resources by querying labels . . . . .	1407
Selector requirement reference . . . . .	1407
<b>Example: Label resources with a git commit . . . . .</b>	<b>1408</b>
Manually label resources . . . . .	1408
Automate labeling resources . . . . .	1409
Prerequisite . . . . .	1409
Example script . . . . .	1409
<b>Example: Add custom tags to log and metric envelopes . . . . .</b>	<b>1410</b>
<b>Custom branding Apps Manager . . . . .</b>	<b>1410</b>
Custom Branding pane . . . . .	1413
Apps Manager pane . . . . .	1414
<b>Planning TAS for VMs orgs and spaces . . . . .</b>	<b>1415</b>
How TAS for VMs layers relate to your company . . . . .	1415

With CPU burst optimization	1426
<b>Enabling Developers</b>	<b>1426</b>
<b>Using Docker in TAS for VMs</b>	<b>1427</b>
Activate Docker image support	1427
Enable and deactivate the diego_docker feature flag	1427
Configure Docker registry access	1427
Docker image contents	1427
How Garden-runC creates containers	1428
How Diego runs and monitors processes	1428
Docker security concerns in a multi-tenant environment	1428
<b>Using Docker registries</b>	<b>1429</b>
Prerequisite: Enable Docker support	1429
Use a CA certificate	1429
Use an IP address allow List	1430
Configure Operations Manager to access proxies for Docker registries	1431
<b>Enabling volume services</b>	<b>1432</b>
Enable NFS volume services	1432
NFS security	1433
Activate SMB volume services	1434
<b>Managing Service Brokers</b>	<b>1434</b>
Quick start	1434
Registering a broker	1435
Making plans public	1435
Multiple brokers, services and plans	1435
Listing service brokers	1436
Updating a broker	1436
Renaming a broker	1436
Removing a broker	1436
Purging a service	1437
Purging a service instance	1437
Catalog validation behaviors	1438
Possible errors	1438
<b>Managing access to Service Plans</b>	<b>1439</b>
Prerequisites	1439
Service Plan access	1439
Enabling access to Service Plans	1440
Enabling access to a subset of users	1440

<b>Deactivating access to Service Plans</b>	<b>1441</b>
Deactivating access to all plans for all users	1441
Deactivating access for specific orgs or plans	1441
Limitations	1442
<b>Dashboard Single Sign-on</b>	<b>1442</b>
<b>Enabling SSO</b>	<b>1442</b>
<b>Service Broker responsibilities</b>	<b>1442</b>

<b>About the ASG Creator tool . . . . .</b>	<b>1618</b>
<b>ASG logging . . . . .</b>	<b>1618</b>
<b>Restricting app access to internal TAS for VMs components . . . . .</b>	<b>1618</b>
<b>App access basics . . . . .</b>	<b>1618</b>
<b>Prerequisites . . . . .</b>	<b>1619</b>
<b>Procedure . . . . .</b>	<b>1619</b>
Step 1: Determine your network layout . . . . .	1619
Step 2: Ensure access for TAS for VMs system apps . . . . .	1620
Step 3: Create new ASGs . . . . .	1621
Part A: Record CIDRs . . . . .	1621
Part B: Create and bind ASGs that block network access . . . . .	1621
Part C: Create and bind ASGs for service access . . . . .	1622
Step 4: Remove the default ASG . . . . .	1623
Step 5: Restart your apps . . . . .	1623
<b>Certificates and Credentials . . . . .</b>	<b>1623</b>
<b>Rotating runtime CredHub encryption keys . . . . .</b>	<b>1624</b>
<b>Rotate TAS for VMs encryption keys . . . . .</b>	<b>1624</b>
<b>Verify encryption key rotation . . . . .</b>	<b>1624</b>
<b>Rotating the Cloud Controller database encryption key . . . . .</b>	<b>1625</b>
<b>Rotate the CCDB encryption key . . . . .</b>	<b>1626</b>
<b>Troubleshoot failed rotation . . . . .</b>	<b>1626</b>
Error: Encryption key(s) have had their values changed . . . . .	1626
Error: Encryption key(s) are still in use but not present in ‘cc.database_encryption.keys’ . . . . .	1627
View encryption keys . . . . .	1627
Tanzu Operations Manager actual-installation.yml . . . . .	1627
CredHub . . . . .	1627
<b>Securing services instance credentials with CredHub . . . . .</b>	<b>1628</b>
<b>Configure TAS for VMs to use CredHub . . . . .</b>	<b>1628</b>

<b>Services that use secure binding credentials</b>	1628
<b>Prerequisites</b>	1629
<b>Step 1: Configure the TAS for VMs tile</b>	1629
<b>Step 2: Create app security groups</b>	1629
<b>Step 3: Unbind and rebind service instances</b>	1630
<b>Providing a certificate for your TLS termination point</b>	1631
<b>Configure TLS termination</b>	1631
<b>Obtain TLS certificates</b>	1631
<b>Create a wildcard certificate for Operations Manager deployments</b>	1631

View and debug processes running in the app container via HTTP .....	2038
Prerequisites .....	2039
Procedure .....	2039
Next Steps .....	2040
<b>Using blue-green deployment to reduce downtime .....</b>	<b>2040</b>
Blue-green deployment with Cloud Foundry example .....	2041
Step 1: Push an app .....	2041
Step 2: Update app and push .....	2041
Step 3: Map original route to Green .....	2042
Step 4: Unmap route to Blue .....	2043
Step 5: Remove temporary route to Green .....	2044
Implementation .....	2044
<b>Troubleshooting app deployment and health .....</b>	<b>2044</b>
Common issues .....	2045
cf push times out .....	2045
App too large .....	2045
Unable to detect a supported app type .....	2046
App deploy fails .....	2046
App requires unique URL .....	2046
App fails to start .....	2047
App consumes too much memory, then fails .....	2048
Routing conflict .....	2048
Gather diagnostic information .....	2048
Examine environment variables .....	2049
View logs .....	2049
Trace Cloud Controller REST API calls .....	2050
Analyze Zipkin trace IDs .....	2050
Use troubleshooting commands .....	2050
Access apps with SSH .....	2051
Send requests to app instance .....	2051
<b>Pushing apps to TAS for VMs [Windows] .....</b>	<b>2051</b>

<b>Deploying .NET Apps .....</b>	<b>2051</b>

.NET Core on Windows .....	2052
.NET Core on Linux .....	2052
Other resources .....	2052
<b>Using SMB Volumes in .NET Apps .....</b>	<b>2052</b>
Prerequisites .....	2052
Using SMB volumes in .NET apps with Steeltoe .....	2052
Using SMB volumes in .NET apps with your batch profile .....	2053
SMB mounting .....	2053
Known issues .....	2056
Inability to SSH into app instance .....	2056
<b>Tips for .NET Framework developers .....</b>	<b>2056</b>
Prerequisites .....	2056
Developing .NET Framework apps .....	2057
.NET on Operations Manager cookbook .....	2057
Pushing a .NET Framework app .....	2057
Context path routing support for ASP.NET apps .....	2057
Activating a graceful shutdown for a .NET app .....	2058
Pushing a self-hosted app .....	2058
Push a SOAP service .....	2059
Step 1: Deploy your web service .....	2059
Step 2: Edit the WSDL file .....	2059
Consuming SOAP Web Service .....	2060
Context path routing support for SOAP Web Services .....	2061
Troubleshooting app errors .....	2061
<b>Getting started deploying Java apps .....</b>	<b>2061</b>
<b>Getting started deploying Grails apps .....</b>	<b>2061</b>
Deploy a Grails application .....	2062
Prerequisites .....	2062
Step 1: (Optional) Declare app dependencies .....	2062
Step 2: (Optional) Allocate sufficient memory .....	2062
Step 3: (Optional) Provide a JDBC driver .....	2063
Step 4: (Optional) Configure a Procfile .....	2063
Step 5: Create and bind a service instance for a Grails application .....	2063
Create a service instance .....	2064
(Optional) Bind a service instance .....	2064
Step 6: (Optional) Configure the deployment manifest file .....	2065
Step 7: Log in and target the API endpoint .....	2065
Step 8: Deploy the application .....	2065
Step 9: Test your deployed app .....	2068
Manage your application with the cf CLI .....	2069
Troubleshooting .....	2069
App deploy fails .....	2069
App requires a unique URL .....	2069

<b>Getting started deploying Ratpack apps .....</b>	<b>2069</b>
<b>Deploy a Ratpack application .....</b>	<b>2070</b>
Prerequisites .....	2070
Step 1: (Optional) Declare app dependencies .....	2070
Step 2: (Optional) Allocate sufficient memory .....	2070
Step 3: (Optional) Provide a JDBC driver .....	2071
Step 4: (Optional) Configure a Procfile .....	2071
Step 5: Create and bind a service instance for a Ratpack application .....	2071
Creating a service instance .....	2071
(Optional) Bind a service instance .....	2072
Step 6: (Optional) Configure the deployment manifest .....	2073
Step 7: Log in and target the API endpoint .....	2073
Step 8: Deploy the app .....	2073
Step 9: Test your deployed app .....	2075
<b>Manage your application with the cf CLI .....</b>	<b>2076</b>
<b>Troubleshooting .....</b>	<b>2076</b>
App deploy fails .....	2076
App requires a unique URL .....	2076
<b>Getting started deploying Spring apps .....</b>	<b>2076</b>
<b>Deploy a Spring application .....</b>	<b>2077</b>
Prerequisites .....	2077
Step 1: (Optional) Declare app dependencies .....	2077
Step 2: (Optional) Allocate sufficient memory .....	2078
Step 3: Provide a JDBC driver .....	2078
Step 4: (Optional) Configure service connections for a Spring app .....	2078
Step 5: Configure the deployment manifest .....	2079
Step 6: Log in and target the API endpoint .....	2079
Step 7: Deploy your app .....	2079
Sample app step .....	2080
Step 8: Test your deployed app .....	2081
<b>Manage your app with the cf CLI .....</b>	<b>2082</b>
<b>Troubleshooting .....</b>	<b>2082</b>
App deploy fails .....	2083
App requires a Content-Type .....	2083
App requires a unique URL .....	2083

Manage org roles	2093
Manage app space roles	2093
Invite new users	2094
Remove a user from an org	2094
Remove a user from a space	2094
<b>Use Apps Manager to add and bind services in TAS for VMs</b>	<b>2094</b>
Step 1: Access the Marketplace	2095
Step 2: Create and configure a service instance	2095
Step 3: Bind a service instance to an application	2095
<b>Managing your apps and service instances using Apps Manager</b>	<b>2096</b>
Prerequisite for Apps Manager	2096
Manage an app	2096
View app overview	2096
Start, stop, or restage an app	2097
Scale an app	2097
Scale an app manually	2098
Activate App Autoscaler	2098
View sidecar processes	2098
View key metrics (beta)	2099
Bind or unbind services	2100
Bind an app to an existing service	2100
Bind an app to a new service	2101
Unbind a service	2101
Map or unmap routes	2102
Map routes	2102
Unmap routes	2102
Create container-to-container networking policies	2102
Manage app revisions	2103
View app revisions	2103
List environment variables for an app revision	2103

Roll back to a previous app revision . . . . .	2103
View logs . . . . .	2104
Manage tasks . . . . .	2104
View tasks . . . . .	2104
Run a task . . . . .	2104
Enable task scheduling . . . . .	2105
Schedule a task . . . . .	2106
View and manage settings . . . . .	2106
Configure health checks . . . . .	2107
View environment variables . . . . .	2107
Add environment variables . . . . .	2107
Add metadata . . . . .	2108
<b>Manage a service instance . . . . .</b>	<b>2108</b>
View service overview . . . . .	2109
Bind an app . . . . .	2109
Unbind an app . . . . .	2110
Share service instance . . . . .	2110
View or change your service plan . . . . .	2111
Rename or delete your service instance . . . . .	2111
View and update spring cloud services configurations . . . . .	2112
Configure user-provided service instance . . . . .	2113
<b>Manage service keys . . . . .</b>	<b>2114</b>
Generate a service key . . . . .	2114
View credentials for a service key . . . . .	2115
Delete service key . . . . .	2115
<b>Manage route services . . . . .</b>	<b>2116</b>
Bind a new service instance to a route . . . . .	2116
Bind an existing service instance to a route . . . . .	2116
Unbind a route from a service instance . . . . .	2117
<b>Viewing your ASGs in Apps Manager . . . . .</b>	<b>2117</b>

# TAS for VMs overview

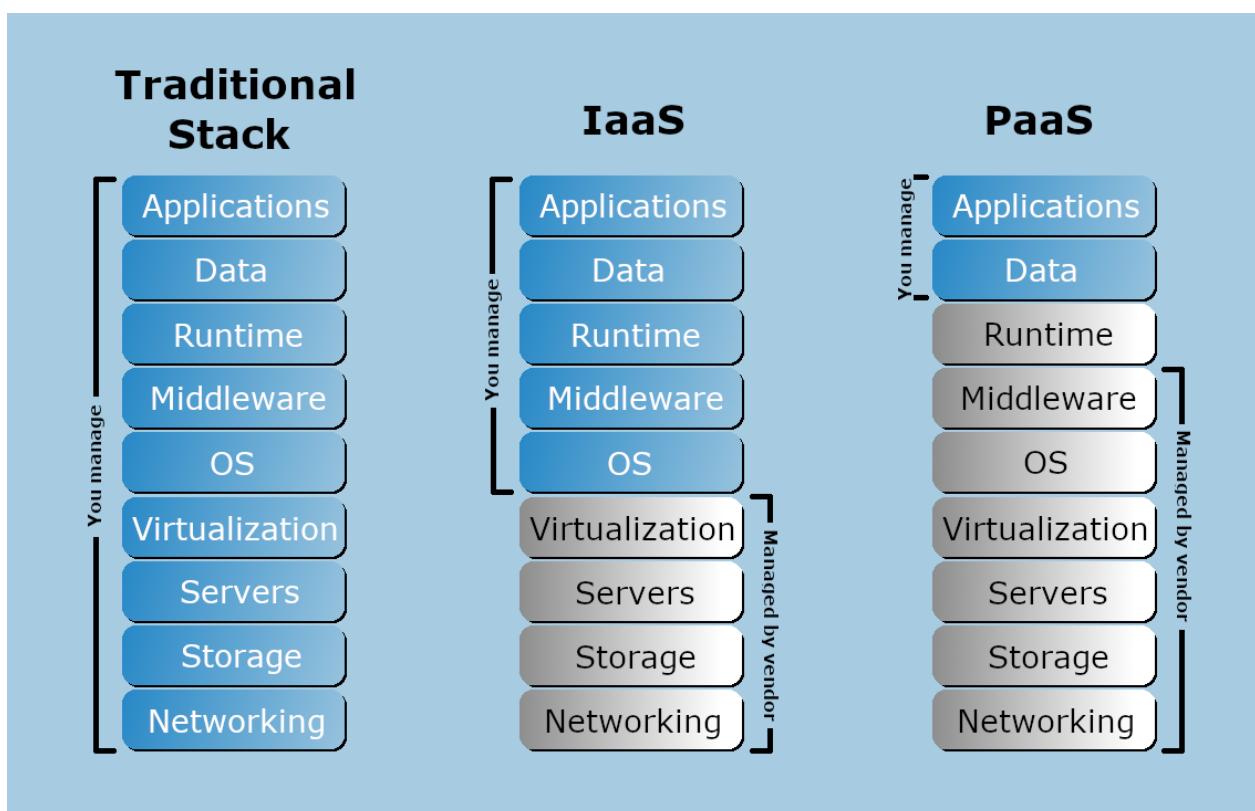

This topic tells you about VMware Tanzu Application Service for VMs (TAS for VMs) and how it works with Tanzu Operations Manager.

## Introduction to Cloud Platforms

Cloud platforms enable rapid deployment of applications and services, making them globally accessible within minutes. When application requests increase, cloud infrastructure can automatically scale to meet higher demand, eliminating traditional build-outs and migrations. This approach allows developers to focus on applications and data without the need to manage underlying infrastructure.

The following diagram illustrates the layers of a typical technology stack, comparing the traditional IT model with an IaaS stack and a PaaS stack, showing which layers are managed by users vs. providers.

- **Traditional IT Stack:** All layers are managed in-house, including applications, data, runtime, middleware, OS, virtualization, servers, storage, and networking.
- **IaaS Stack:** The provider manages the servers, storage, networking, and virtualization, while the user manages applications, data, runtime, middleware, and OS.
- **PaaS Stack:** The provider manages all layers except for applications and data, which remain the user's responsibility.

[View a larger version of this diagram.](#)

## About TAS for VMs

This section describes why TAS for VMs is an industry-standard cloud platform.

Not all cloud platforms are created equal. Some have limited language and framework support, lack key app services, or restrict deployment to a single cloud.

As an industry-standard cloud platform, TAS for VMs offers the following:

- **Open source code:** The platform's openness and extensibility prevent its users from being locked into a single framework, set of app services, or cloud. For more information, see the [Cloud Foundry](#) project on GitHub.
- **Deployment automation:** Developers can deploy their apps to TAS for VMs using their existing tools and with zero modification to their code.
- **Flexible infrastructure:** You can deploy TAS for VMs to run your apps on your own computing infrastructure, or deploy on an IaaS like vSphere, AWS, Azure, GCP, or OpenStack.
- **Commercial options:** You can also use a PaaS deployed by a commercial TAS for VMs cloud provider. For more information, see [Cloud Foundry Certified Platforms](#).
- **Community support:** A broad community contributes to and supports TAS for VMs. See [Welcome to the Cloud Foundry Community](#).

TAS for VMs is ideal for anyone interested in removing the cost and complexity of configuring infrastructure for their apps.

## How TAS for VMs Works

To flexibly serve and scale apps online, TAS for VMs has subsystems that perform specialized functions. The following sections describe how some of these main subsystems work.

### Load balancing

This section describes how TAS for VMs handles load balancing.

Clouds balance their processing loads over multiple machines, optimizing for efficiency and resilience against point failure. A TAS for VMs installation accomplishes this using the following components:

- **BOSH** creates and deploys VMs on top of a physical computing infrastructure, and deploys and runs TAS for VMs on top of this cloud. To configure the deployment, BOSH follows a manifest document. For more information, see the [BOSH documentation](#).
- **Cloud Controller** runs the apps and other processes on the cloud's VMs, balancing demand and managing app lifecycles. For more information, see [Cloud Controller](#).
- The **Gorouter** routes incoming traffic from the world to the VMs that are running the apps that the traffic demands, usually working with a customer-provided load balancer. For more information, see [TAS for VMs Routing Architecture](#).

### Running apps

This section describes the VMs that run your apps in TAS for VMs and how the platform packages your apps to run on these VMs.

## VMs in TAS for VMs

TAS for VMs designates the following types of VMs:

- **Component VMs** make up the platform's infrastructure.
- **Host VMs** host your apps for the outside world.

Within TAS for VMs, the Diego system distributes the hosted app load over all of the host VMs, and keeps it running and balanced through demand surges, outages, or other changes. Diego accomplishes this through an auction algorithm.

For more information, see [Diego Components and Architecture](#).

## Distributing apps

To meet demand, multiple host VMs run duplicate instances of the same app. This means that apps must be portable. TAS for VMs distributes app source code to VMs with everything the VMs need to compile and run the apps locally.

TAS for VMs includes the following with your app's source code:

- **Stack**: the operating system the app runs on.
- **Buildpack**: contains all languages, libraries, and services that the app uses.

Before sending an app to a VM, the Cloud Controller stages it for delivery by combining the stack, buildpack, and source code into a droplet that the VM can unpack, compile, and run. For simple, standalone apps with no dynamic pointers, the droplet can contain a pre-compiled executable instead of source code, language, and libraries.

For more information, see:

- [Changing Stacks](#)
- [Buildpacks](#)
- [How Apps Are Staged](#)

## Organizing users and workspaces

This section describes how TAS for VMs organizes users and workspaces.

TAS for VMs manages user accounts through two User Account and Authentication (UAA) servers, which support access control as OAuth2 services and can store user information internally, or connect to external user stores through LDAP or SAML.

For more information, see [User Account and Authentication \(UAA\) Server](#).

The following table describes what the two UAA servers do:

Server	Purpose
First UAA server	<ul style="list-style-type: none"> <li>Grants access to BOSH</li> <li>Holds accounts for Tanzu Operations Manager operators who deploy runtimes, services, and other software onto the BOSH layer directly</li> </ul>
Second UAA server	<ul style="list-style-type: none"> <li>Controls access to the Cloud Controller</li> <li>Defines user roles, such as admin, developer, or auditor, and grants them different sets of privileges to run TAS for VMs commands</li> <li>Scopes the roles to separate, compartmentalized orgs and spaces within an installation to manage and track use</li> </ul>

For more information, see [Orgs, Spaces, Roles, and Permissions](#).

## Storing resources

The following table describes where TAS for VMs stores resources:

Resource	Storage Location
<ul style="list-style-type: none"> <li>Source code</li> <li>Buildpacks</li> <li>Documentation</li> <li>Custom configurations</li> <li>Other platform resources</li> </ul>	GitHub
<ul style="list-style-type: none"> <li>Large binary files</li> <li>Droplets</li> </ul>	Internal or external blobstore
<ul style="list-style-type: none"> <li>Internal component states</li> <li>Other temporary information</li> </ul>	MySQL

## Communicating with components

This section describes how TAS for VMs components communicate with one another.

TAS for VMs components communicate in the following ways:

- By sending messages internally using HTTP and HTTPS protocols
- By sending NATS messages to each other directly

BOSH Director co-locates a BOSH DNS server on every deployed VM. All VMs keep up-to-date DNS records for all the other VMs in the same foundation. This enables service discovery between VMs.

BOSH DNS allows deployments to continue communicating with VMs even when the VMs' IP addresses change. It also provides client-side load balancing by randomly selecting a healthy VM when multiple VMs are available.

For more information about BOSH DNS, see [Native DNS Support](#) in the BOSH documentation.

## Monitoring and Analyzing

This section describes logging in TAS for VMs.

TAS for VMs generates system logs from TAS for VMs components and app logs from hosted apps. As TAS for VMs runs, its component and host VMs generate logs and metrics. TAS for VMs apps also typically generate logs.

The following table describes where TAS for VMs sends logs:

Log Type	Destination
TAS for VMs component logs	Rsyslog agents
TAS for VMs component metrics	Loggregator
App logs	Loggregator

Component logs stream from rsyslog agents, and the cloud operator can configure them to stream out to a syslog drain.

The Loggregator system aggregates the component metrics and app logs into a structured, usable form, the Firehose. You can use all of the output of the Firehose, or direct the output to specific uses, such as monitoring system internals, triggering alerts, or analyzing user behavior, by applying nozzles.

For more information, see [Loggregator Architecture](#).

## Using services

This section describes how you can use services with your apps on TAS for VMs.

Typical apps depend on free or metered services such as databases or third-party APIs. To incorporate these into an app:

1. **Write a Service Broker:** This component manages the life cycle of the service. The Service Broker uses the Service Broker API to advertise a catalog of service offerings to TAS for VMs apps.
2. **Provision the Service Instance:** Create an instance of the service offering by sending a provision request to the Service Broker API.
3. **Enable apps to access the Service Instance:** Configure the TAS for VMs app to make calls to the Service Instance using the Service Broker API.

For more information, see [Services](#).

## Small Footprint TAS for VMs

The Small Footprint TAS for VMs is a repackaging of the TAS for VMs components into a smaller deployment with fewer virtual machines (VMs). For a description of the limitations that come with a smaller deployment, see [Limitations](#).

## Differentiate small footprint TAS for VMs and TAS for VMs

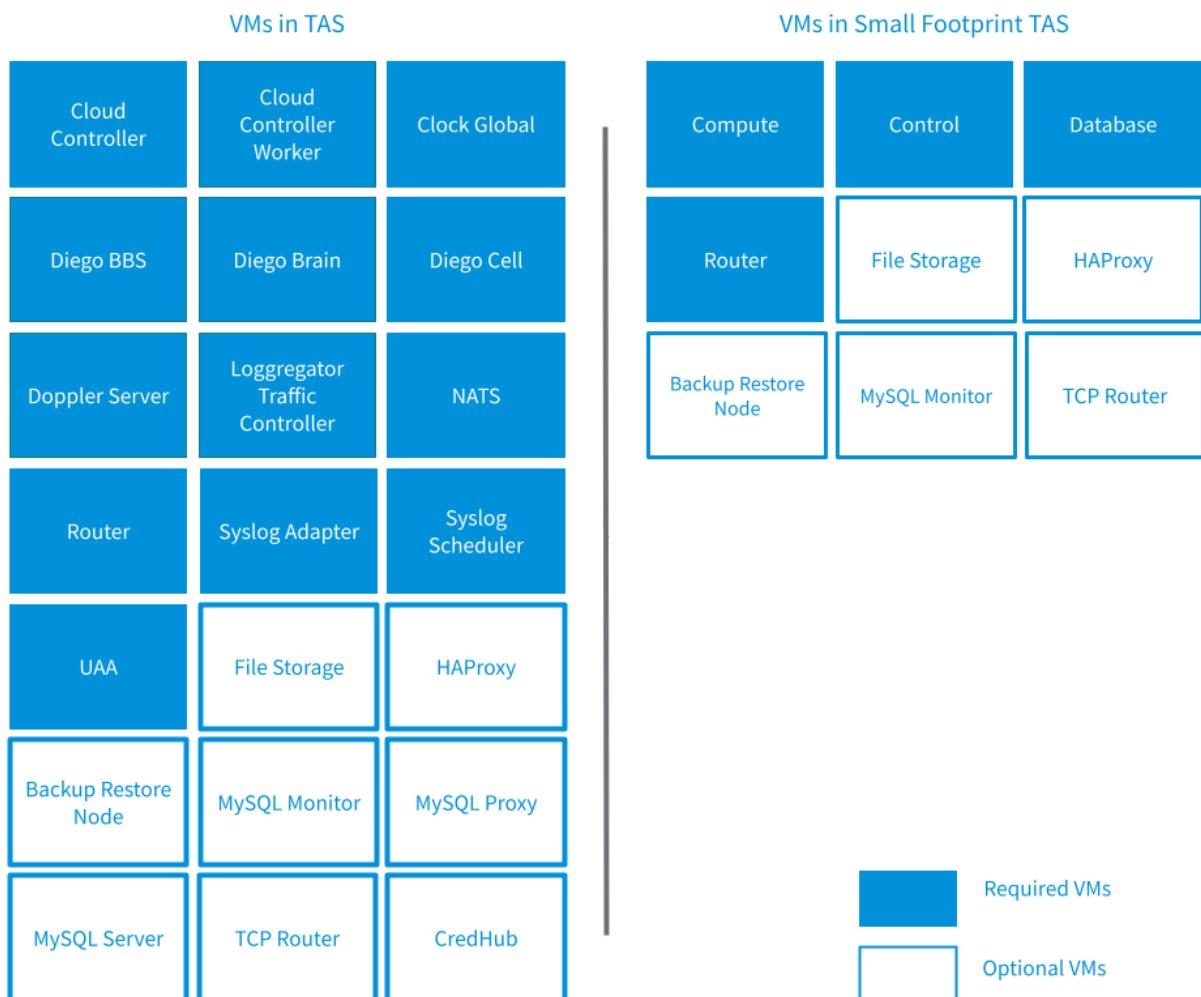

A standard TAS for VMs deployment must have at least 13 VMs, but Small Footprint TAS for VMs requires only four.

- Required VMs: Cloud Controller, Cloud Controller Worker, Clock Global, Diego BBS, Diego Brain, Diego Cell, Doppler Server, Loggregator Traffic Controller, NATS, Router, Syslog Adapter, Syslog Scheduler, and UAA.
- Optional VMs: File Storage, HAProxy, Backup Restore Node, MySQL Monitor, MySQL Proxy, MySQL Server, TCP Router, and CredHub.

For Small Footprint TAS for VMs:

- Required VMs: Compute, Control, Database, and Router.
- Optional VMs: File Storage, HAProxy, Backup Restore Node, MySQL Monitor, and TCP Router.

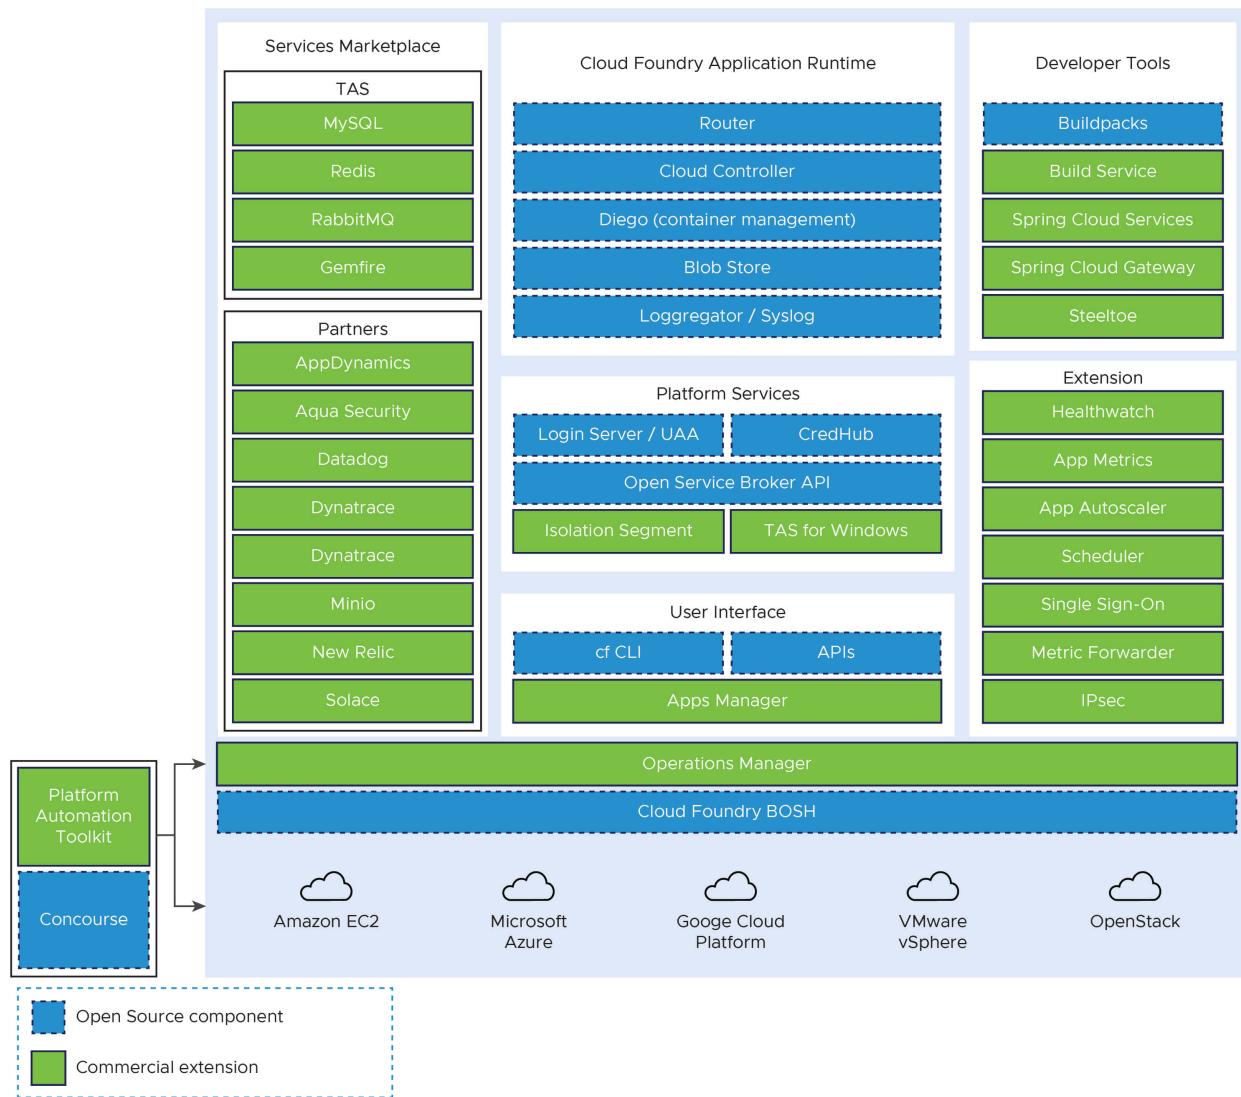

The following image displays a comparison of the number of VMs deployed by TAS for VMs and Small Footprint TAS for VMs.

## How TAS for VMs Differs from Open Source Cloud Foundry

Open-source software provides the basis for TAS for VMs, which is the VMware distribution of [Cloud Foundry Application Runtime](#) software for hosting apps. VMware offers additional commercial features, enterprise services, support, documentation, certificates, and other value-adds.

The following diagram shows open source Cloud Foundry components in blue and commercial features available with TAS for VMs in green:

# TAS for VMs v6.0 Release notes

These are the release notes for VMware Tanzu Application Service for VMs (TAS for VMs) v6.0.

**Known Issue:** cf-networking-release versions 3.67.0 - 3.70.0 contain a bug that breaks pagination for listing and removing container-to-container (c2c) network policies when the user has more than 100 roles, as is often the case for users involved in automated provisioning. This bug only affects listing and removing network policies and not enforcing those policies. This bug also does not affect Application Security Groups. For more information, see this [Knowledge Base article](#).

**Affected versions:** 6.0.14, 6.0.15, 6.0.16, 6.0.17

Addresses Policy Server database migration failures and crashes seen when upgrading to version 4.0.35, 6.0.15, and 10.0.5.

This reverts the previous feature improvement - "Multiple enhancements to Application Security Group data syncing when using Dynamic ASGs at very high scale" which was added in 4.0.35, 6.0.15, and 10.0.5.

TAS for VMs is certified by the Cloud Foundry Foundation for 2024.

For more information about the Cloud Foundry Certified Provider Program, see [How Do I Become a Certified Provider?](#) on the Cloud Foundry website.

Because VMware uses the Percona Distribution for MySQL, expect a time lag between Oracle releasing a MySQL patch and VMware releasing TAS for VMs containing that patch.

**Deprecation Notice:** Cloud Foundry Command-Line Interface (cf CLI) v7 is deprecated and will lose support. For how to upgrade to cf CLI v8 see [Upgrading to cf CLI v8](#).

**Important cross-version issues:**

- **v6.0.7 - v6.0.11** versions contain a bug that causes intermittent TCP connectivity issues between TAS for VMs and tiles that use `routing` release 0.301.0 or earlier, such as Tanzu for MySQL on Cloud Foundry v3.3.0 and earlier, and Redis for Tanzu Application Service v3.5.0 and earlier. For details, see [TCP Routes from Tiles are Pruned Intermittently Resulting in connectivity issues](#)
- **v6.0.0 - v6.0.3** versions contain an RFC protocol issue with Gorouter, CVE-2024-22279, that can lead to denial of service. The issue has been fixed. For details, see [TNZ-2024-0100](#).

## Releases

### 6.0.18

**Release Date:** 07/22/2025

- **[Feature]** Add new component “NATS Monitor” to detect and fix NATS server split brains. See the “Networking” tab to configure this new component.
- **[Feature]** Allow automatic creation of UAA Shadow users
- **[Feature Improvement]** Restrict binary log footprint to 24h for internal PXC database
- **[Bug Fix]** Fixes a bug where users were unable to list network policies when they had more than 100 non-admin space roles assigned
- Bump binary-offline-buildpack to version [1.1.52](#)
- Bump capi to version [1.212.0](#)
- Bump cf-autoscaling to version [250.5.5](#)
- Bump cf-networking to version [3.72.0](#)
- Bump cflinuxfs3 to version [0.642.0](#)
- Bump cflinuxfs4 to version [1.317.0](#)
- Bump credhub to version [2.14.6](#)
- Bump diego to version [2.118.0](#)
- Bump dotnet-core-offline-buildpack to version [2.4.73](#)
- Bump garden-runc to version [1.73.0](#)
- Bump go-offline-buildpack to version [1.10.71](#)
- Bump java-offline-buildpack to version [4.85.0](#)
- Bump mysql-monitoring to version [10.26.0](#)
- Bump nats to version [56.52.0](#)
- Bump nats-monitor to version [0.0.9](#)
- Bump nfs-volume to version [7.32.0](#)
- Bump nginx-offline-buildpack to version [1.2.61](#)
- Bump nodejs-offline-buildpack to version [1.8.72](#)
- Bump notifications to version [81.0.3](#)
- Bump notifications-ui to version [57.0.1](#)
- Bump php-offline-buildpack to version [4.6.60](#)
- Bump push-apps-manager-release to version [677.0.80](#)
- Bump push-usage-service-release to version [674.0.177](#)
- Bump pxc to version [1.1.1](#)
- Bump python-offline-buildpack to version [1.8.68](#)
- Bump r-offline-buildpack to version [1.2.55](#)
- Bump routing to version [0.342.0](#)

- Bump ruby-offline-buildpack to version [1.10.53](#)
- Bump silk to version [3.72.0](#)
- Bump smb-volume to version [3.30.0](#)
- Bump staticfile-offline-buildpack to version [1.8.49](#)
- Bump uaa to version [77.20.7](#)

cf-networking	3.72.0	<p>▼ v3.72.0</p> <pre>## 3.72.0 **Release Date**: June 16, 2025 ## Changes - Dependency Bumps ## Built with go 1.24.4 **Full Changelog**: <a href="https://github.com/cloudfoundry/cf-networking-release/compare/v3.71.0...v3.72.0">https://github.com/cloudfoundry/cf-networking-release/compare/v3.71.0...v3.72.0</a> ## Resources - [Download release 3.72.0 from bosh.io](<a href="https://bosh.io/releases/github.com/cloudfoundry/cf-networking-release?version=3.72.0">https://bosh.io/releases/github.com/cloudfoundry/cf-networking-release?version=3.72.0</a>).</pre> <p>▼ v3.71.0</p> <pre>## 3.71.0 **Release Date**: June 11, 2025 ## Changes - Fixes a bug where policy-server's network-policy list API would break when a user had more than 100 roles in CF. This affected both the `cf network-policies` and `cf remove-network-policy` commands. Thanks @mariash! - Modifies policy-server DB migrations to happen inside the `policy-server` main command, instead of as a pre-start, to remove our reliance on a custom fork of the migration library. Thanks @kart2bc ! - Refactored cni-loader to work with non-deprecated config loading functions. Thanks @kart2bc ! - Bumped to golang 1.24.4 ## Built with go 1.24.4 **Full Changelog**: <a href="https://github.com/cloudfoundry/cf-networking-release/compare/v3.70.0...v3.71.0">https://github.com/cloudfoundry/cf-networking-release/compare/v3.70.0...v3.71.0</a> ## Resources - [Download release 3.71.0 from bosh.io](<a href="https://bosh.io/releases/github.com/cloudfoundry/cf-networking-release?version=3.71.0">https://bosh.io/releases/github.com/cloudfoundry/cf-networking-release?version=3.71.0</a>).</pre>

Component	Version	Release Notes
diego	2.118.0	<p>▼ v2.118.0</p> <pre> ## 2.118.0 **Release Date**: June 12, 2025 ## Changes - Bumped to golang 1.24.4 - Bumped to jq 1.8 - Go Dependency bumps - Δ Removes the ability to configure logging.format.timestamp. All logging timestamps are now in rfc3339 format for readability. Thanks @kart2bc! - Adds the ability to specify a default timeout when using declarative healthchecks in the event an app does not specify one.  ## Bosh Job Spec changes: ```diff diff --git a/jobs/auctioneer/spec b/jobs/auctioneer/spec index 1fac48936..e7445644b 100644 --- a/jobs/auctioneer/spec +++ b/jobs/auctioneer/spec @@ -99,10 +99,6 @@ properties: description: When set, the auctioneer attempts to claim a lock from the Locket API. default: true - logging.format.timestamp: -   description: "Format for timestamp in component logs. #### ▼ v4.84.1

Buildpacks provided by this bosh release:

- java-buildpack-offline-cflinuxfs3-v4.82.0.zip
- java-buildpack-offline-cflinuxfs4-v4.82.0.zip

I'm pleased to announce the release of the `java-buildpack`, version `4.82.0`.

This release includes dependency updates, including for Tomcat 9 & 10.1 and the latest Java patch releases.

Dependency	Version	CVEs	Release Notes
AppDynamics Agent	`25.2.0_36823`		[Release Notes] ( <a href="https://docs.appdynamics.com/apd/onprem/24.x/latest/en/product-and-release-announcements/release-notes">https://docs.appdynamics.com/apd/onprem/24.x/latest/en/product-and-release-announcements/release-notes</a> )
Azure Application Insights Agent	`3.7.2`		[Release Notes] ( <a href="https://github.com/Microsoft/ApplicationInsights-Java/releases">https://github.com/Microsoft/ApplicationInsights-Java/releases</a> )
CA Introscope APM Framework	`25.5.1_11`		
Client Certificate Mapper	`2.0.1`		Included inline above

tanzu-jammy-stack	1.0.1	

## 6.0.16

**Known Issue:** cf-networking-release versions 3.67.0 - 3.70.0 contain a bug that breaks pagination for listing and removing container-to-container (c2c) network policies when the

user has more than 100 roles, as is often the case for users involved in automated provisioning. This bug only affects listing and removing network policies and not enforcing those policies. This bug also does not affect Application Security Groups. For more information, see this [Knowledge Base article](#).

**Affected versions:** 6.0.14, 6.0.15, 6.0.16, 6.0.17

**Release Date:** 05/15/2025

- **[Feature]** Add property to control UAA disableInResponseToCheck
- **[Feature Improvement]** Make Dynamic ASG sync interval properties configurable in the “Networking” tab. These properties will allow operators to configure the sync frequency between Cloud Controller, the Policy Server, and the Diego Cells for ASGs. The more frequent the syncing, the faster ASG updates will be propagated through the foundation. However, more frequent syncing will add more load to the system.
- **[Feature Improvement]** Operators can now configure debug logging for NATS servers in the “Networking” tab.
- Bump binary-offline-buildpack to version [1.1.41](#)
- Bump bpm to version [1.4.20](#)
- Bump capi to version [1.209.0](#)
- Bump cf-cli to version [2.1.0](#)
- Bump cf-networking to version [3.70.0](#)
- Bump cflinuxfs3 to version [0.630.0](#)
- Bump cflinuxfs4 to version [1.302.0](#)
- Bump credhub to version [2.13.3](#)

- Bump push-usage-service-release to version 674.0.165
- Bump python-offline-buildpack to version 1.8.57
- Bump r-offline-buildpack to version 1.2.44
- Bump routing to version 0.337.0
- Bump ruby-offline-buildpack to version 1.10.44
- Bump silk to version 3.70.0
- Bump smb-volume to version 3.25.0
- Bump staticfile-offline-buildpack to version 1.8.38

## Known Issues

### Addresses Policy Server database migration failures and crashes

Addresses Policy Server database migration failures and crashes seen when upgrading to version 4.0.35, 6.0.15, and 10.0.5.

This reverts the previous feature improvement - "Multiple enhancements to Application Security Group data syncing when using Dynamic ASGs at very high scale" which was added in 4.0.35, 6.0.15, and 10.0.5.

## Security Fixes

The following table lists CVEs that were fixed in each TAS for VMs component since the previous patch version of TAS for VMs:

Component	Vulnerabilities Resolved
bpm	<ul style="list-style-type: none"> <li>• <a href="#">CVE-2025-22871</a> (critical)</li> </ul>

| routing   | 0.337.0 | <p>▼ v0.337.0</p> <pre> ## 0.337.0 **Release Date**: May 07, 2025 ## Changes - gorouter source code has been inlined directly into this release, and the separate repository has been archived. Thank you so much @maxmoehl!!! - Additional request timeout properties have been added to routing-release + gorouter to provide more flexibility with overall request timeouts. Previously `request_timeout_in_seconds` applied to both HTTP/1 and HTTP/2 requests. This limited the ability to guard against slowloris attacks for HTTP/1 requests while also allowing GRPC streams over HTTP/2 to live indefinitely. `request_timeout_in_seconds` is now used as a default value for the new `http_1_request_timeout_in_seconds` and `http_2_request_timeout_in_seconds` properties. See the property descriptions below for more information. Thanks @kart2bc! - Dependency updates ## Bosh Job Spec changes: ```diff diff --git a/jobs/gorouter/spec b/jobs/gorouter/spec index d373561e..a88b19ab 100644 --- a/jobs/gorouter/spec +++ b/jobs/gorouter/spec @@ -523,6 +523,16 @@ properties: Requests from router to backend endpoints that are longer than this duration will be canceled and logged as `backend-request-timeout` errors. If set to 0 this timeout is disabled. default: 900 + http_1_request_timeout_in_seconds: +   description:   +     The amount of time HTTP/1 requests from the Gorouter to apps are allowed to live before being canceled. +     Enter value in seconds. Set to -1 to disable timeouts. If set to 0, it inherits the value from request_timeout_in_seconds. +   default: 0 + http_2_request_timeout_in_seconds: +   description:   +     The amount of time HTTP/2 requests from the Gorouter to apps are allowed to live before being canceled. +     Enter value in seconds. ## TAS for VMs v6.0 Release notes

These are the release notes for VMware Tanzu Application Service for VMs (TAS for VMs) v6.0 patch releases v6.0.11 to v6.0.15.

**Known Issue:** cf-networking-release versions 3.67.0 - 3.70.0 contain a bug that breaks pagination for listing and removing container-to-container (c2c) network policies when the user has more than 100 roles, as is often the case for users involved in automated provisioning. This bug only affects listing and removing network policies and not enforcing those policies. This bug also does not affect Application Security Groups. For more information, see this [Knowledge Base article](#).

**Affected versions:** 6.0.14, 6.0.15, 6.0.16

TAS for VMs is certified by the Cloud Foundry Foundation for 2024.

For more information about the Cloud Foundry Certified Provider Program, see [How Do I Become a Certified Provider?](#) on the Cloud Foundry website.

Because VMware uses the Percona Distribution for MySQL, expect a time lag between Oracle releasing a MySQL patch and VMware releasing TAS for VMs containing that patch.

---

**Deprecation Notice:** Cloud Foundry Command-Line Interface (cf CLI) v7 is deprecated and will lose support. For how to upgrade to cf CLI v8 see [Upgrading to cf CLI v8](#).

**Important cross-version issues:**

- **v6.0.7 - v6.0.11** versions contain a bug that causes intermittent TCP connectivity issues between TAS for VMs and tiles that use `routing` release 0.301.0 or earlier, such as Tanzu for MySQL on Cloud Foundry v3.3.0 and earlier, and Redis for Tanzu Application Service v3.5.0 and earlier. For details, see [TCP Routes from Tiles are Pruned Intermittently Resulting in connectivity issues](#)
- **v6.0.0 - v6.0.3** versions contain an RFC protocol issue with Gorouter, CVE-2024-22279, that can lead to denial of service. The issue has been fixed. For details,

see TNZ-2024-0100.

## Releases

### 6.0.15

**Release Date:** 04/15/2025

Do not upgrade to TAS for VMs v10.0.5, v6.0.15, or v4.0.35 if you are using dynamic ASGs enabled with Silk, as configured under **Networking**, and a MySQL database, as configured under **Databases**. These releases have policy server database issues that the next patch releases will resolve. For details, see the following articles in the Broadcom Support KB:

- [Migration failures cause policy server pre-start errors](#)
- [Cloud Controller "policy-server-asg-syncer" job in crash loop](#)

- **[Feature]** There is a new “Enable container network traffic metrics for app instances” property in the “Networking” tab
- **[Feature Improvement]** Multiple enhancements to Application Security Group data syncing when using Dynamic ASGs at very high scale
- **[Breaking Change]** Gorouter now uses Go 1.24, because of this Gorouter’s limit on 1xx informational responses has changed. It previously aborted a request and returned an error after receiving more than 5 1xx responses. It now returns an error if the total size of all 1xx responses exceeds 10MB.
- Bump binary-offline-buildpack to version [1.1.35](#)
- Bump bpm to version [1.4.17](#)
- Bump capi to version [1.206.0](#)
- Bump cf-cli to version [2.0.0](#)
- Bump cf-networking to version [3.69.0](#)
- Bump cflinuxfs3 to version [0.623.0](#)
- Bump cflinuxfs4 to version [1.296.0](#)
- Bump credhub to version [2.13.1](#)
- Bump dotnet-core-offline-buildpack to version [2.4.56](#)
- Bump go-offline-buildpack to version [1.10.53](#)
- Bump java-offline-buildpack to version [4.82.0](#)
- Bump log-cache to version [3.1.10](#)
- Bump loggregator to version [107.0.21](#)
- Bump loggregator-agent to version [8.3.7](#)

- Bump metric-registrar to version [4.0.8](#)
- Bump mysql-monitoring to version [10.23.0](#)
- Bump nats to version [56.45.0](#)
- Bump nfs-volume to version [7.25.0](#)
- Bump nginx-offline-buildpack to version [1.2.42](#)
- Bump nodejs-offline-buildpack to version [1.8.56](#)
- Bump notifications to version [78.0.0](#)
- Bump otel-collector to version [0.11.4](#)
- Bump php-offline-buildpack to version [4.6.44](#)
- Bump push-apps-manager-release to version [677.0.70](#)
- Bump push-usage-service-release to version [674.0.161](#)
- Bump pxc to version [1.0.39](#)
- Bump python-offline-buildpack to version [1.8.51](#)
- Bump r-offline-buildpack to version [1.2.37](#)
- Bump routing to version [0.334.0](#)
- Bump ruby-offline-buildpack to version [1.10.38](#)
- Bump silk to version [3.69.0](#)
- Bump smb-volume to version [3.24.0](#)
- Bump staticfile-offline-buildpack to version [1.8.31](#)
- Bump statsd-injector to version [1.11.48](#)
- Bump syslog to version [12.3.9](#)
- Bump system-metrics-scraper to version [4.0.18](#)

## Security Fixes

The following table lists CVEs that were fixed in each TAS for VMs component since the previous patch version of TAS for VMs:

| Component | Vulnerabilities Resolved                                                                                                                           |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| capi      | <ul style="list-style-type: none"> <li>• <a href="#">GHSA-mrxw-mxhj-p664</a> (high)</li> <li>• <a href="#">CVE-2025-22871</a> (unknown)</li> </ul> |

| Component                  | Vulnerabilities Resolved                                                                                                                                                                                                                                                                                                                                                                                                      |

| nats      | 56.45.0 | <p>▼ v56.45.0</p> <pre> ## 56.45.0 **Release Date**: April 04, 2025 ## Changes - Bumps nats-server to version [2.11.1-binary] (<a href="https://github.com/nats-io/nats-server/releases/tag/v2.11.1-binary">https://github.com/nats-io/nats-server/releases/tag/v2.11.1-binary</a>) to address CVE-2025-30215 - Switches from a source-based packaging of nats-server to the official binary distributions. - Bumps to golang 1.24.2 ## Built with go 1.24.2 **Full Changelog**: <a href="https://github.com/cloudfoundry/nats-release/compare/v56.44.0...v56.45.0">https://github.com/cloudfoundry/nats-release/compare/v56.44.0...v56.45.0</a> ## Resources - [Download release 56.45.0 from bosh.io] (<a href="https://bosh.io/releases/github.com/cloudfoundry/nats-release?version=56.45.0">https://bosh.io/releases/github.com/cloudfoundry/nats-release?version=56.45.0</a>).</pre> <p>▼ v56.44.0</p> <pre> ## 56.44.0 **Release Date**: April 02, 2025 ## Changes - Updates link properties related to `nats.migration_client.tls` - includes an unused binary blob for nats-server (we are in the process of switching to binary-based nats-server distributions rather than compiling from source, but this blob is not yet used. The source distribution of nats-server is still used in this release. Stay tuned!) ## Bosh Job Spec changes: ```diff diff --git a/jobs/nats/spec b/jobs/nats/spec c index daf89d6..68e5221 100644 --- a/jobs/nats/spec +++ b/jobs/nats/spec @@ -40,9 +40,9 @@ provides: - nats.write_deadline - nats.disable - nats.migrate_server.port - - nats.migrate_client.tls.ca: - - nats.migrate_client.tls.certificate: - - nats.migrate_client.tls.private_key: + - nats.migrate_client.tls.ca + - nats.migrate_client.tls.certificate + - nats.migrate_client.tls.private_key consumes: - name: nats ``` </pre> |

| routing   | 0.334.0 | <p>▼ v0.334.0</p> <pre> ## 0.334.0 **Release Date**: March 31, 2025 ## Changes - feat: Introduce switch for envelope v1 metrics - <a href="https://github.com/cloudfoundry/routing-release/pull/456">https://github.com/cloudfoundry/routing-release/pull/456</a> - Thanks @b1tamara and @mike-jc ! - revert fix for race condition now that race condition does not exist - <a href="https://github.com/cloudfoundry/gorouter/pull/469">https://github.com/cloudfoundry/gorouter/pull/469</a> - This change + Go 1.24 changes how 1XX responses are handled. This might affect users: [Transport] (<a href="https://tip.golang.org/pkg/net/http#Transport">https://tip.golang.org/pkg/net/http#Transport</a>)'s limit on 1xx informational responses received in response to a request has changed. It previously aborted a request and returned an error after receiving more than 5 1xx responses. It now returns an error if the total size of all 1xx responses exceeds the [Transport.MaxResponseHeaderBytes] (<a href="https://tip.golang.org/pkg/net/http#Transport.MaxResponseHeaderBytes">https://tip.golang.org/pkg/net/http#Transport.MaxResponseHeaderBytes</a>) configuration setting. ## Bosh Job Spec changes: ```diff diff --git a/jobs/gorouter/spec b/jobs/gorouter/spec index 1feb42f7..d373561e 100644 --- a/jobs/gorouter/spec +++ b/jobs/gorouter/spec @@ -76,8 +76,14 @@ properties: description: "TLS Certificate used for the TLS listener of the LB healthcheck endpoint" router.status.tls.key: description: "Private Key used for the TLS listener of the LB healthcheck endpoint" + router.enable_envelope_v1_metrics: +   description: "Enables support for metrics reported via Envelope." +   default: true router.prometheus.port: -   description: "Port for the prometheus endpoint." +   description: "Port for the prometheus endpoint. ## 6.0.14

**Release Date:** 03/25/2025

- **[Feature]** Gorouter respects new `X-CF-PROCESS-INSTANCE` header for routing to specific app processes, especially helpful for testing canary deployments. See [these docs](#) for more information.
- **[Feature Improvement]** Canary deployments support a new `--instance-steps` flag that allows for fine-grained control over a canary deployment rollout. See [these docs](#) for more information.
- Bump binary-offline-buildpack to version `1.1.34`
- Bump capi to version `1.205.0`
- Bump cf-autoscaling to version `250.4.3`
- Bump cf-networking to version `3.67.0`
- Bump cflinuxfs3 to version `0.620.0`
- Bump cflinuxfs4 to version `1.291.0`
- Bump credhub to version `2.12.108`
- Bump dotnet-core-offline-buildpack to version `2.4.52`
- Bump go-offline-buildpack to version `1.10.48`
- Bump java-offline-buildpack to version `4.81.0`
- Bump nginx-offline-buildpack to version `1.2.38`
- Bump nodejs-offline-buildpack to version `1.8.52`
- Bump notifications-ui to version `55.0.0`
- Bump php-offline-buildpack to version `4.6.41`
- Bump push-apps-manager-release to version `677.0.68`
- Bump push-usage-service-release to version `674.0.158`
- Bump pxc to version `1.0.38`
- Bump python-offline-buildpack to version `1.8.47`
- Bump r-offline-buildpack to version `1.2.33`
- Bump routing to version `0.332.0`
- Bump ruby-offline-buildpack to version `1.10.37`
- Bump staticfile-offline-buildpack to version `1.8.28`
- Bump uaa to version `77.20.4`

## Security Fixes

The following table lists CVEs that were fixed in each TAS for VMs component since the previous patch version of TAS for VMs:

| Component | Vulnerabilities Resolved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 6.0.13

**Release Date:** 03/11/2025

- **[Feature]** Operators can now “Enable comma-delimited lists of IPs for application security group (ASG) destinations” via the property in the “Networking” tab. **WARNING:** for foundations with the NSX-T tile installed, you **MUST** deploy NSX-T tile version 9.0.0 in policy mode before enabling this feature.
- **[Feature Improvement]** Operators can now let Puma auto-configure the number of workers based on the number of available cores.
- **[Feature Improvement]** Remove the need to track mapfs-release

- **[Feature Improvement]:** Backport GA OpenTelemetry Collector
- **[Bug Fix]** SMB Broker now supports all the mount parameters that the SMB Driver does ('sec', 'dir\_mode', 'file\_mode' were missing)
- Bump backup-and-restore-sdk to version [1.19.45](#)
- Bump binary-offline-buildpack to version [1.1.32](#)
- Bump bpm to version [1.4.16](#)
- Bump capi to version [1.203.0](#)
- Bump cf-autoscaling to version [250.4.1](#)
- Bump cf-networking to version [3.66.0](#)
- Bump cflinuxfs3 to version [0.618.0](#)
- Bump cflinuxfs4 to version [1.288.0](#)
- Bump credhub to version [2.12.105](#)
- Bump dotnet-core-offline-buildpack to version [2.4.51](#)
- Bump garden-runc to version [1.70.0](#)
- Bump go-offline-buildpack to version [1.10.43](#)
- Bump java-offline-buildpack to version [4.80.0](#)
- Bump log-cache to version [3.1.9](#)
- Bump loggregator to version [107.0.20](#)
- Bump loggregator-agent to version [8.3.5](#)
- Bump mysql-monitoring to version [10.22.0](#)
- Bump nats to version [56.41.0](#)
- Bump nfs-volume to version [7.23.0](#)
- Bump nginx-offline-buildpack to version [1.2.37](#)
- Bump nodejs-offline-buildpack to version [1.8.49](#)
- Bump php-offline-buildpack to version [4.6.40](#)
- Bump push-apps-manager-release to version [677.0.67](#)
- Bump push-usage-service-release to version [674.0.156](#)
- Bump pxc to version [1.0.37](#)
- Bump python-offline-buildpack to version [1.8.44](#)
- Bump r-offline-buildpack to version [1.2.32](#)
- Bump routing to version [0.331.0](#)
- Bump ruby-offline-buildpack to version [1.10.36](#)
- Bump silk to version [3.66.0](#)

- Bump smb-volume to version 3.22.0
- Bump staticfile-offline-buildpack to version 1.8.26
- Bump statsd-injector to version 1.11.47
- Bump syslog to version 12.3.7
- Bump system-metrics-scraper to version 4.0.17
- Bump uaa to version 77.20.3

## Security Fixes

The following table lists CVEs that were fixed in each TAS for VMs component since the previous patch version of TAS for VMs:

| Component                 | Vulnerabilities Resolved                                                                                                                                                         |

## 6.0.12

**Release Date:** 02/03/2025

- **[Bug Fix]** Fix intermittent connectivity issue for TCP routes from external tiles with old routing-release versions
- **[Feature Improvement]** Apps Manager only lists the name of a space that hosts shared services if you have access to that space; otherwise it lists the space's GUID.
- **[Feature Improvement]** Add optional, experimental pprof extension to OTel Collector
- **[Feature Improvement]** Enable Space Auditors to view app autoscaling rules

- **[Feature Improvement]** Explicitly set the allowed ciphers for Diego ssh proxy. Previously these were set in the code.
- **[Feature Improvement]** Puma web server is no longer beta
- Bump backup-and-restore-sdk to version [1.19.39](#)
- Bump binary-offline-buildpack to version [1.1.28](#)
- Bump bpm to version [1.4.11](#)
- Bump capi to version [1.200.0](#)
- Bump cf-autoscaling to version [250.4.0](#)
- Bump cf-networking to version [3.63.0](#)
- Bump cflinuxfs3 to version [0.592.0](#)
- Bump cflinuxfs4 to version [1.274.0](#)
- Bump credhub to version [2.12.102](#)
- Bump dotnet-core-offline-buildpack to version [2.4.47](#)
- Bump garden-runc to version [1.67.0](#)
- Bump go-offline-buildpack to version [1.10.37](#)
- Bump java-offline-buildpack to version [4.77.0](#)
- Bump log-cache to version [3.1.8](#)
- Bump loggregator to version [107.0.19](#)
- Bump loggregator-agent to version [8.3.3](#)
- Bump mapfs to version [1.17.0](#)
- Bump metric-registrar to version [4.0.6](#)
- Bump mysql-monitoring to version [10.21.0](#)
- Bump nats to version [56.36.0](#)
- Bump nfs-volume to version [7.17.0](#)
- Bump nginx-offline-buildpack to version [1.2.33](#)
- Bump nodejs-offline-buildpack to version [1.8.44](#)
- Bump notifications to version [77.0.0](#)
- Bump otel-collector to version [0.11.2](#)
- Bump php-offline-buildpack to version [4.6.36](#)
- Bump push-apps-manager-release to version [677.0.66](#)
- Bump push-usage-service-release to version [674.0.147](#)
- Bump pxc to version [1.0.34](#)
- Bump python-offline-buildpack to version [1.8.40](#)

- Bump r-offline-buildpack to version 1.2.28
- Bump routing to version 0.329.0
- Bump ruby-offline-buildpack to version 1.10.32
- Bump silk to version 3.63.0
- Bump smb-volume to version 3.16.0
- Bump staticfile-offline-buildpack to version 1.8.21
- Bump statsd-injector to version 1.11.46
- Bump syslog to version 12.3.6
- Bump system-metrics-scraper to version 4.0.15
- Bump uaa to version 77.20.2

## Security Fixes

The following table lists CVEs that were fixed in each TAS for VMs component since the previous patch version of TAS for VMs:

| Component                 | Vulnerabilities Resolved                                                                                                                                                                                                                                                            |

| routing   | 0.329.0 | <p>▼ v0.329.0</p> <pre> ## 0.329.0 **Release Date**: January 21, 2025 ## Changes - **BREAKING CHANGE**: The `lb_algo` load balancing option key name has been renamed to `loadbalancing`. This standardizes the name across components. Read more about this change [here](https://github.com/cloudfoundry/community/pull/1039). - Bump to go 1.23.5. - Bump dependancies. ## Bosh Job Spec changes: ```diff diff --git a/jobs/route_registrar/spec b/jobs/route_registrar/spec index b9afabbe..c39eac91 100644 --- a/jobs/route_registrar/spec +++ b/jobs/route_registrar/spec @@ -144,7 +144,7 @@ properties:  writable (optional, boolean): sets the writable flag. defaults to false  options object  - lb_algo (optional, string): Load balancing algorithm for routing incoming requests to the backend: 'round-robin' or 'least-connection'. ## 6.0.11

**Release Date:** 01/09/2025

- **[Bug Fix]** Stop Autoscaler panic when RabbitMQ password includes reserved characters
- Bump backup-and-restore-sdk to version [1.19.36](#)
- Bump binary-offline-buildpack to version [1.1.15](#)

- Bump bpm to version [1.4.6](#)
- Bump capi to version [1.197.0](#)
- Bump cf-autoscaling to version [250.3.6](#)
- Bump cf-cli to version [1.68.0](#)
- Bump cf-networking to version [3.60.0](#)
- Bump credhub to version [2.12.98](#)
- Bump dotnet-core-offline-buildpack to version [2.4.36](#)
- Bump garden-runc to version [1.64.0](#)
- Bump go-offline-buildpack to version [1.10.24](#)
- Bump log-cache to version [3.1.7](#)
- Bump loggregator to version [107.0.18](#)
- Bump loggregator-agent to version [8.3.2](#)
- Bump mapfs to version [1.12.0](#)
- Bump metric-registrar to version [4.0.5](#)
- Bump nats to version [56.32.0](#)
- Bump nfs-volume to version [7.13.0](#)
- Bump nginx-offline-buildpack to version [1.2.20](#)
- Bump nodejs-offline-buildpack to version [1.8.30](#)
- Bump notifications to version [74.0.0](#)
- Bump notifications-ui to version [51.0.0](#)
- Bump php-offline-buildpack to version [4.6.25](#)
- Bump push-apps-manager-release to version [677.0.64](#)
- Bump push-usage-service-release to version [674.0.137](#)
- Bump pxc to version [1.0.33](#)
- Bump python-offline-buildpack to version [1.8.30](#)
- Bump r-offline-buildpack to version [1.2.16](#)
- Bump routing to version [0.325.0](#)
- Bump ruby-offline-buildpack to version [1.10.19](#)
- Bump silk to version [3.60.0](#)
- Bump smb-volume to version [3.13.0](#)
- Bump staticfile-offline-buildpack to version [1.6.18](#)
- Bump statsd-injector to version [1.11.45](#)
- Bump syslog to version [12.3.5](#)

- Bump system-metrics-scraper to version [4.0.13](#)
- Bump uaa to version [77.20.0](#)

## Security Fixes

The following table lists CVEs that were fixed in each TAS for VMs component since the previous patch version of TAS for VMs:

| Component                 | Vulnerabilities Resolved                                                                                                                                           |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| binary-offline-buildpack  | <ul style="list-style-type: none"><li>• <a href="#">CVE-2024-34156</a></li><li>• <a href="#">CVE-2024-34158</a></li><li>• <a href="#">CVE-2024-34155</a></li></ul> |

#### ▼ 2.4.34

```

* Upgrade Sealights version to 1.5.0
* Add dotnet-sdk 6.0.427, remove dotnet-sdk
6.0.425
for stack(s) cflinuxfs4, cflinuxfs3
* Add dotnet-sdk 8.0.403, remove dotnet-sdk
8.0.401
for stack(s) cflinuxfs4, cflinuxfs3
* Add dotnet-aspnetcore 8.0.10, remove dotn
et-aspnetcore 8.0.8
for stack(s) cflinuxfs4, cflinuxfs3
* Add dotnet-aspnetcore 6.0.35, remove dotn
et-aspnetcore 6.0.33
for stack(s) cflinuxfs4, cflinuxfs3
* Add dotnet-runtime 6.0.35, remove dotnet-

#### ▼ v77.18.0

```

## What's Changed
### New UAA
* Bump to [UAA v77.18.0] (https://github.com/cloudfoundry/uaa/releases/tag/v77.18.0)
### Fixes
* [CVE-2024-38821] (https://spring.io/security/cve-2024-38821)
* [CVE-2024-21235] (https://nvd.nist.gov/vuln/detail/CVE-2024-21235)
### Dependency Bumps
* [Upgrade Bellsoft JDK to version 17.0.13+12] (https://github.com/cloudfoundry/uaa-release/commit/364cad45653130db03a5f2a87bd697722bcc8c) -> [CVE-2024-21235] (https://nvd.nist.gov/vuln/detail/CVE-2024-21235)
* [Upgrade Tomcat to version 9.0.96] (https://github.com/cloudfoundry/uaa-release/commit/1cd0037b07de2896008cfbddc4766815cb4eeee9)
* Bump github.com/cloudfoundry/bosh-utils from 0.0.499 to 0.0.500 in /src/acceptance_tests by @dependabot in https://github.com/cloudfoundry/uaa-release/pull/969
* Bump activesupport from 7.2.1 to 7.2.1.1 by @dependabot in https://github.com/cloudfoundry/uaa-release/pull/970
* Bump rspec-core from 3.13.1 to 3.13.2 by @dependabot in https://github.com/cloudfoundry/uaa-release/pull/971
**Full Changelog**: https://github.com/cloudfoundry/uaa-release/compare/v77.17.0...v77.18.0

```

|                   |         | 8.0           |
| tanzu-jammy-stack | 1.0.1   |               |

## 6.0.1 - 6.0.10

See [TAS Patch Version v6.0.1-v6.0.10 Release Notes](#).

## New features in VMware Tanzu Application Service for VMs v6.0

These are the new features for VMware Tanzu Application Service for VMs v6.0.

### Updates to GenAI for Tanzu Application Service (beta)

- **Improved vSphere Support:** Platform engineers can now deploy large language models on larger GPUs, such as the Nvidia A100, on VMware vSphere-backed deployments. This allows for larger models to be deployed and for improved inferencing times
- **Azure Support:** GenAI for Tanzu Application Service, has been validated to work with Azure as a support IaaS destination in addition to AWS, GCP, and vSphere, providing customers with more choices across cloud providers
- **Multi-Model Support:** GenAI for Tanzu Application Service now supports multiple worker models running simultaneously, which expands the types of applications that can use this service. This enables platform engineers to deploy multiple types of LLMs optimized for different use cases. For instance, a platform engineer can deploy a model optimized for chatbots and models optimized for code completion
- **Improved inferencing speeds with vLLM support:** In addition to the [fastchat](#) deployment option, platform engineers can serve LLMs via [vLLM](#), optimized for inference throughput. This improves overall model response times and preparation for running models in production

### Improved Autoscaling based on Application CPU Usage

- **Managing CPU-based autoscaling** rules for their apps with less tuning and fewer errors: App Autoscaler has been updated to use CPU entitlement metrics, which greatly improves the overall autoscaling of applications based on CPU usage. App Autoscaler provides a new rule that monitors an app's average usage of its CPU entitlement and scales the app up or down accordingly.
  - Unlike with the previous CPU processor utilization rule, the scaling thresholds for this rule do not need to change when developers adjust the memory allocation for the app or when the platform engineers adjust the size of the underlying Diego cell container-host VMs. When configured through the improved autoscaling UI in Apps Manager, developers get sensible default values of 30% and 80% for the low and high scaling thresholds, which should be a good starting point for most apps. Developers should have an easier and more intuitive experience configuring this new autoscaling rule for their apps.

## Improved Platform Footprint and Enhanced Operations

- **Small footprint** now supports an in-place upgrade to a full Tanzu Application Service Installation: [Small footprint for Tanzu Application Service](#) now supports customers that want to upgrade to a “full” Tanzu Application Service installation. Small footprint Tanzu Application Service was generally considered to be used for proof of concept or sandbox environments, but this upgrade path will allow platform engineers to migrate to full installation without having to reinstall the platform. This should allow organizations to start with an overall smaller footprint (~4-6 virtual machines) at a lower cost and gives them the option to grow their platform footprint in their own time. The small footprint for Tanzu Application Service is also fully supported for production use and can be utilized in locations with limited infrastructure footprint, such as an edge location.
- **Availability Zone Aware routing for Gorouter:** The Gorouter has a new, opt-in feature to prefer local routing within an Availability Zone. When this option is enabled, the Gorouters will attempt to route all application traffic to application instances running on Diego cells within their local availability zone. This will improve the overall network traffic path and reduce overall round-trip latency to improve application performance. Gorouters will prefer not to send traffic to traffic to application instances running on other Availability Zones, but will in the event that no application instances are running in their zone.
- **Scale your dopplers and traffic controllers all the way to 0:** For Tanzu Application Service installations using aggregate syslog drains to send app logs and metrics via the syslog protocol, platform engineers can now completely turn off the doppler and traffic controller VMs at the core of the loggregator subsystem. This optimization represents another step forward in the transition towards the new, more efficient “shared-nothing” observability architecture that is incrementally replacing earlier generations of observability subsystems, and helps platform engineers further reduce their infrastructure costs. Note: To completely scale down to 0, platform engineers must stop the use of firehose nozzles and other tiles that utilize nozzles, such as Healthwatch and App Metrics.
- **Human-readable foundation names in the platform log stream:** Platform engineers can configure a human-readable foundation tag in their outgoing platform log stream. This will improve the overall experience when sending multiple foundation log streams to a log aggregation platform, as platform engineers will be able to identify what foundation is sending logs, ultimately avoiding mistakes and eliminating the need to re-work.
- **Certificate Rotation Dashboard for internal certificate management:** Tanzu Operations Manager has been updated to include a Certificate Rotation Dashboard to continuously improve the internal platform certification rotation and management process. The dashboard allows platform engineers to track certification rotation status to easily understand the next step for the certificate rotation process within their Tanzu Application Service environments.
- **Configurable App File descriptor limits:** Tanzu Application Service allows platform engineers to change the default Linux file descriptor limits for applications running on the platform. This feature enables applications to move to the platform that requires larger than normal numbers of Unix file descriptors. This allows for more application types to be migrated onto the Tanzu Application Service platform.

## Enhancements to Enable Improved Platform Security Postures

- **Early access to FIPS-compliant stemcells:** Tanzu Application Service now supports the use of **FIPS-compliant** Jammy stemcells through early access to federal customers for their TAS foundations. Please reach out to the Tanzu team if interested in testing out this feature.
- **Manage local User Account and Authentication (UAA) Password policies when external identity providers are configured:** Local UAA password policies can be set and maintained in conjunction with an external identity provider. This change enables better security posture for platform engineers who are managing local platform accounts.

## Tanzu Application Service Ecosystem Optimizations

Enhancements to the AWS Cloud Service Broker

- **Support for the AWS Simple Queue Service (SQS):** Platform engineers can now add production-ready plans for the AWS SQS service to their Tanzu Application Service marketplace offerings. Developers can easily deploy and use the AWS SQS service to expand upon their application use cases just like any other service supported by the Cloud Service Broker.
- **Support for AWS GovCloud Regions:** The Cloud Service Broker for AWS is now supported for use in AWS GovCloud Regions. Customers who wish to use these regions can now begin to migrate off the legacy AWS service broker and take advantage of all the new features and functionality of the Cloud Service Broker, allowing them with more options across cloud providers.

## Reduced logging and metric infrastructure requirements

If you do not use the legacy V1 and V2 Loggregator Firehoses, you now can scale Doppler and Traffic Controller VMs down to zero. This can significantly reduce costs or free up resources for running additional workloads on the platform. You might not be able to scale down to zero if you use integrations or other features that depend on the Firehose, such as log and metric nozzles or Metric Registrar.

### Reintroduction of global log rate limit

TAS for VMs v3.0 introduced granular app log rate limits for fine-grained control over application log rates.

TAS for VMs v4.0 removed the older global log rate limit feature **App log rate limit (deprecated)** under **App Containers**. This was problematic for operators who were performing a jump upgrade to TAS for VMs v4.0 (skipping v3.0), as logs would not be rate limited until application-based log rate limits were applied.

TAS for VMs v6.0 restores the global log rate limit, so that operators can perform upgrades while retaining log rate limits. Operators must configure the same setting separately for both Isolation Segment and TAS for VMs [Windows].

If you had previously set a global log rate limit, this limit is re-applied following the upgrade to VMware Tanzu Application Service for VMs v6.0.

### App Autoscaler supports scaling on CPU entitlement

VMware Tanzu Application Service for VMs v6.0 introduces support for autoscaling on CPU entitlement. This improves App Autoscaler support for scaling on CPU. Previously, App Autoscaler CPU rules could be brittle due to their dependency on the underlying Diego Cell configuration. With this feature, apps can autoscale on the CPU entitlement available, calculated appropriately based on the memory allocated.

## Breaking Changes

For breaking changes when upgrading VMware Tanzu Application Service for VMs to v6.0, see [Breaking Changes](#).

## Known issues

Here are the known issues for VMware Tanzu Application Service for VMs v6.0.

### cf-networking-release versions 3.67.0 - 3.70.0 bug can break pagination

cf-networking-release versions 3.67.0 - 3.70.0 contain a bug that breaks pagination for listing and removing container-to-container (c2c) network policies when the user has more than 100 roles, as is often the case for users involved in automated provisioning. This bug only affects listing and removing network policies and not enforcing those policies. This bug also does not affect Application Security Groups. For more information, see this [Knowledge Base article](#).

**Affected versions:** 6.0.14, 6.0.15, 6.0.16

### Loggregator Agents in other products may log failure when Dopplers are scaled to zero

Service tile products can use Loggregator Agent to egress metrics for service instances. If the Doppler instance group is scaled to zero, then Loggregator Agent jobs deployed by these products may repeatedly log a failure to connect to Doppler:

```
failed to connect: unable to lookup a log consumer
```

### UAA causes database overload (for VMware Tanzu Application Service for VMs 6.0.0 and 6.0.1)

The UAA can cause and experience slowness in its database when attempting to hit its [/Users](#) endpoint. The issue is especially noticeable when the UAA contains a large number of users; for example, in the millions. This only happens when using a MySQL database. VMware Tanzu Application Service for VMs 6.0.2 fixes the issue.

## TAS Patch Version v6.0.1-v6.0.10 Release Notes

These are the release notes for VMware Tanzu Application Service for VMs (TAS for VMs) v6.0 patch releases v6.0.1 to v6.0.10.

See [VMware Tanzu Application Service for VMs v6.0 Release Notes](#) for current patch release notes.

## Releases

### 6.0.10

**Release Date:** 11/19/2024

**[Bug Fix]** Fix memory leak in route registrar. **[Bug Fix]** Resolves an issue where NFS-volume mounts occasionally failed on Diego Cells due to excessive rpcbind/stad process restarts. **[Bug Fix]** Resolves an issue where tcp\_router would erroneously be updated during deploys. **[Bug Fix]** Gorouter now properly calculates header sizes when limiting “Maximum request header size” on HTTP requests.

- Bump backup-and-restore-sdk to version 1.19.35
- Bump capi to version 1.194.0
- Bump cf-autoscaling to version 250.3.5
- Bump cf-networking to version 3.52.0
- Bump cflinuxfs3 to version 0.417.0
- Bump credhub to version 2.12.93
- Bump loggregator-agent to version 8.3.0
- Bump nfs-volume to version 7.8.0
- Bump routing to version 0.319.0
- Bump silk to version 3.52.0
- Bump smb-volume to version 3.9.0
- Bump uaa to version 77.17.0

## 6.0.9

**Release Date:** 10/07/2024

### Caution

This release is affected by a memory leak in the route registrar job, which is present on multiple VMs. To mitigate this issue see the following [Downtime for TCP Routes When Upgrading IST, TASW, and Services Tiles before TAS in TPCF](#) in the Broadcom Support Knowledge Base.

- Bump backup-and-restore-sdk to version [1.19.34](#)
- Bump bpm to version [1.4.0](#)
- Bump cf-networking to version [3.51.0](#)
- Bump cflinuxfs3 to version [0.416.0](#)
- Bump cflinuxfs4 to version [1.130.0](#)

- Bump credhub to version 2.12.92
- Bump diego to version 2.105.0
- Bump garden-runc to version 1.57.0
- Bump go-offline-buildpack to version 1.10.23
- Bump mapfs to version 1.4.0
- Bump nats to version 56.25.0
- Bump nfs-volume to version 7.4.0
- Bump notifications-ui to version 50.0.0
- Bump php-offline-buildpack to version 4.6.24
- Bump push-apps-manager-release to version 677.0.60
- Bump r-offline-buildpack to version 1.2.15
- Bump silk to version 3.51.0
- Bump smb-volume to version 3.5.0
- Bump staticfile-offline-buildpack to version 1.6.17

| nfs-volume | 7.4.0   | <p>▼ v7.4.0</p> <pre> ## 7.4.0 **Release Date**: October 01, 2024 ## Changes - Updates the nfsbrokerpush errand to apply the security group to staging containers as well as running, for greater success talking to credhub in test environments. Thanks @jochenehret! - Updates the BBR metadata to add more CAP I dependencies to resolve intermittent lock/unlock race conditions when running pre-restore actions in BBR. Thanks @davewalter! ## Built with go 1.23.1 **Full Changelog**: <a href="https://github.com/cloudfoundry/nfs-volume-release/compare/v7.3.0...v7.4.0">https://github.com/cloudfoundry/nfs-volume-release/compare/v7.3.0...v7.4.0</a> ## Resources - [Download release 7.4.0 from bosh.io](https://bosh.io/releases/github.com/cloudfoundry/nfs-volume-release?version=7.4.0). </pre> <p>▼ v7.3.0</p> <pre> ## 7.3.0 **Release Date**: September 30, 2024 ## Changes - [Output rpcbind and statd logs to a sensible place] (<a href="https://github.com/cloudfoundry/nfs-volume-release/commit/bb54df64b42100c5c64b98a2818258f2a51cb79e">https://github.com/cloudfoundry/nfs-volume-release/commit/bb54df64b42100c5c64b98a2818258f2a51cb79e</a>) - [Add retries for monit statd and rpcbind check] (<a href="https://github.com/cloudfoundry/nfs-volume-release/commit/03f06e61244424593f34b44e0b7a7dce06d6773">https://github.com/cloudfoundry/nfs-volume-release/commit/03f06e61244424593f34b44e0b7a7dce06d6773</a>) - [Remove sqlite] (<a href="https://github.com/cloudfoundry/nfs-volume-release/commit/86327f2336dbfeadc2bb0389d981c41f6815750">https://github.com/cloudfoundry/nfs-volume-release/commit/86327f2336dbfeadc2bb0389d981c41f6815750</a>) - [Remove libevent and rpcsvc-proto] (<a href="https://github.com/cloudfoundry/nfs-volume-release/commit/6e818a0ca00f79f8117d69eebab95a7273170239">https://github.com/cloudfoundry/nfs-volume-release/commit/6e818a0ca00f79f8117d69eebab95a7273170239</a>) - [Remove nfs-legacy option] (<a href="https://github.com/cloudfoundry/nfs-volume-release/commit/bc3fb7a609434acb966fab601df110be18a2f0b">https://github.com/cloudfoundry/nfs-volume-release/commit/bc3fb7a609434acb966fab601df110be18a2f0b</a>) - [Output rpcbind and statd logs to a sensible place #1024] (<a href="https://github.com/cloudfoundry/nfs-volume-release/pull/1024">https://github.com/cloudfoundry/nfs-volume-release/pull/1024</a>) - [Add retries for monit statd and rpcbind check #1027] (<a href="https://github.com/cloudfoundry/nfs-volume-release/pull/1027">https://github.com/cloudfoundry/nfs-volume-release/pull/1027</a>) - [Add retries for monit statd and rpcbind check #1027] (<a href="https://github.com/cloudfoundry/nfs-volume-release/pull/1027">https://github.com/cloudfoundry/nfs-volume-release/pull/1027</a>) - [Remove unneeded packages for nfs-debs #1](#) </pre> |

## 6.0.8

Release Date: 09/27/2024

### Caution

This release is affected by a memory leak in the route registrar job, which is present on multiple VMs. To mitigate this issue see the following [Downtime for TCP Routes When Upgrading IST, TASW, and Services Tiles before TAS in TPCF](#) in the Broadcom Support Knowledge Base.

- **[Feature]** Allow operators to configure the number of local workers per Cloud Controller API VM
- **[Feature]** Users can configure the innodb buffer pool for the internal MySQL database
- **[Feature Improvement]** Cloud Controller Web Server now uses percentage based memory thresholds
- **[Feature Improvement]** Optionally log revision id in app log sources.
- **[Feature Improvement]** Reduce unnecessary mysql disk writes

- **[Bug Fix]** Add full path to stacks property in migration to set cflinuxfs4 as default stack
- **[Bug Fix]** Migrate DB Encryption Key
- **[Bug Fix]** Removes STOPPING state from CAPI v3 process stats API
- Bump backup-and-restore-sdk to version [1.19.33](#)
- Bump bpm to version [1.3.2](#)
- Bump capi to version [1.193.0](#)
- Bump cf-autoscaling to version [250.3.2](#)
- Bump cf-cli to version [1.67.0](#)
- Bump cf-networking to version [3.50.0](#)
- Bump cflinuxfs3 to version [0.407.0](#)
- Bump credhub to version [2.12.91](#)
- Bump diego to version [2.103.0](#)
- Bump dotnet-core-offline-buildpack to version [2.4.33](#)
- Bump garden-runc to version [1.56.0](#)
- Bump go-offline-buildpack to version [1.10.22](#)
- Bump java-offline-buildpack to version [4.73.0](#)
- Bump log-cache to version [3.1.5](#)
- Bump loggregator to version [107.0.17](#)
- Bump loggregator-agent to version [8.2.1](#)
- Bump mapfs to version [1.3.0](#)
- Bump metric-registrar to version [4.0.3](#)
- Bump mysql-monitoring to version [10.16.0](#)
- Bump nats to version [56.24.0](#)
- Bump nfs-volume to version [7.2.0](#)
- Bump nginx-offline-buildpack to version [1.2.19](#)
- Bump nodejs-offline-buildpack to version [1.8.29](#)
- Bump notifications to version [73.0.0](#)
- Bump otel-collector to version [0.10.1](#)
- Bump php-offline-buildpack to version [4.6.23](#)
- Bump push-apps-manager-release to version [677.0.56](#)
- Bump push-usage-service-release to version [674.0.123](#)
- Bump pxc to version [1.0.31](#)
- Bump python-offline-buildpack to version [1.8.29](#)

- Bump r-offline-buildpack to version 1.2.14
- Bump routing to version 0.311.0
- Bump ruby-offline-buildpack to version 1.10.18
- Bump silk to version 3.50.0
- Bump smb-volume to version 3.4.0
- Bump staticfile-offline-buildpack to version 1.6.16
- Bump statsd-injector to version 1.11.43
- Bump syslog to version 12.3.3
- Bump system-metrics-scraper to version 4.0.11
- Bump uaa to version 77.16.0

## 6.0.7

**Release Date:** 08/22/2024

- **[Feature]** Add Beta support for Puma webserver in Cloud Controller
- **[Feature]** Adds support for Cloud Controller Prometheus Metrics
- **[Bug Fix]** Fixes known issue [Downtime for TCP Routes When Upgrading IST, TASW, and Services Tiles before TAS in TPCF](#)
- **[Bug Fix]** Resolves an issue with routing-api's migration leading to broken TCP Routes when TAS uses a Postgres database
- **[Bug Fix]** Turn off ccdb paginate window to improve performance
- **[Feature Improvement]** Improved the Appsmanager User Interface. Contrast improvements and new font for improved readability.
- **[Feature Improvement]** Improved Appsmanager performance by increasing Cloud Controller request page size.
- Bump backup-and-restore-sdk to version [1.19.27](#)
- Bump bpm to version [1.3.0](#)
- Bump capi to version [1.189.0](#)
- Bump cf-autoscaling to version [250.3.1](#)
- Bump cflinuxfs3 to version [0.391.0](#)
- Bump credhub to version [2.12.86](#)
- Bump diego to version [2.102.0](#)
- Bump garden-runc to version [1.54.0](#)
- Bump java-offline-buildpack to version [4.72.0](#)
- Bump java-native-image-cnb-buildpack to version [0.11.22](#)
- Bump loggregator to version [107.0.16](#)
- Bump loggregator-agent to version [8.1.5](#)
- Bump metric-registrar to version [4.0.2](#)
- Bump nats to version [56.22.0](#)
- Bump nodejs-offline-buildpack to version [1.8.27](#)
- Bump notifications-ui to version [49.0.0](#)
- Bump otel-collector to version [0.7.0](#)
- Bump push-apps-manager-release to version [677.0.53](#)

- Bump push-usage-service-release to version 674.0.119
- Bump r-offline-buildpack to version 1.2.13
- Bump routing to version 0.304.0
- Bump web-servers-cnb-buildpack to version 0.15.2
- Bump statsd-injector to version 1.11.42
- Bump syslog to version 12.3.1
- Bump system-metrics-scraper to version 4.0.10
